Gold is the most malleable of all metals. It can be drawn into a monoatomic wire, and then stretched about twice before it breaks. Such nanowires distort via formation, reorientation and migration of dislocations and crystal twins without noticeable hardening. A single gram of gold can be beaten into a sheet of 1 square meter, and an ...

Electrical resistivity (also called specific electrical resistance or volume resistivity) and its converse, electrical

conductivity, is a fundamental property of a material that quantifies how strongly it resists or conducts the flow of electric current.
