To protect the unit from heat, Thorlabs recommends applying an actuation pulse followed by a holding voltage. To keep the unit on for a long period of time, the holding voltage must be  $\approx 12$  V. Applying an actuation voltage that is below 8 V may open the shutter; however other timing specs cannot be guaranteed.

Basal ganglia (BG) circuits orchestrate complex motor behaviors predominantly via inhibitory synaptic outputs. Although these inhibitory BG outputs are known to reduce the excitability of postsynaptic target neurons, precisely how this change impairs motor performance remains poorly understood.
