This animation explores the chemical components and bonds of the nucleotides that make up DNA. As shown in the animation, DNA is a polymer of units called nucleotides, which contain deoxyribose sugars and nitrogenous bases.

This page, looking at the structure of DNA, is the first in a sequence of pages leading on to how DNA replicates (makes copies of) itself, and then to how information stored in DNA is used to make protein molecules.

Nucleic acid structure refers to the structure of nucleic acids such as DNA and RNA. Chemically speaking, DNA and RNA are very similar. Nucleic acid structure is often divided into four different levels: primary, secondary, tertiary and quaternary.

Introduction. DNA methylation at carbon 5 position of cytosine (5mC) is an important postreplicative modification, which mainly regulates gene expression, genomic imprinting, and other processes of epigenetic inheritance. In vertebrates, methylation predominately occurs in a CpG dinucleotide context in the genome and is established and ...
